

## MPX fastener

### For Multiplex (MPX) high current connectors

Allows for safe and quick mounting as well as reliable connections of MPX-High-Current-Connectors

Fast and simple mounting

### Mounting Instructions:

The MPX-bracket allows for simple fastening of MPX-High-Current-Connectors in fuselages, wings and so on. Additionally due to detents, a vibration less connection of the connected socket is possible. The connection is simply released by slightly moving left and right and pulling the connected cable manually.

Please only use originally manufactured MPX-Connectors (available in our shop). Assembled multipart sockets which are sometimes offered, can fall apart when disconnected.

The MPX-High-Current-Connector (readily soldered with the cable) is glued into the housing using instant adhesive or 5-minute epoxy resin. The MPX-bracket is primarily suitable for plugs (not sockets => female). The housing with the glued plug is screwed to the base using 4 screws (e.g. 2.2mm sheet metal screws).

The delivered chamfered spacer can be put under in order to mount the plug in a small angle. Through this, the opposite cable can be unplugged more easily.
